

University Hospitals Bristol NHS Foundation Trust has selected Brother's TD-2130 Professional Labelling Solution for their integrated blood sample

Customer: University Hospitals Bristol NHS Foundation Trust
Country: United Kingdom
Model number: TD-2130N

The Customer

With more than a thousand beds over 72 healthcare facilities, University Hospitals Bristol NHS Foundation Trust is serving a population of more than 500,000 patients in United Kingdom.

The Challenge

They need to upgrade to a new order communications system. Their project requires streamlining their label printers to simplify their consumables ordering processes which can be quite challenging.

The Solution

They have selected and installed more than 300 units of Brother's TD-2130N Professional label printers across their hospitals to integrate seamlessly with their patients' records system to print labels for blood samples and replaced their previous units from another manufacturer.

As their same units are used for several other labelling processes, it has reduced their number of different label print media and simplify their ordering process for replacement labels. As their labels are thermally printed, no replacement toners or ink cartridges are required.

Prior to their installation, their printers were pre-configured to allow plug-and-play installation which can work with their hand-in-glove and order communications devices which allow a straightforward and convenient label creation and printing process for their staff.

The Result

With simplified consumables order and stock process, it has helped to save time.

“Ease of use and reliability are critical for us. Bringing technical staff into our facilities to repair technology can cause significant issues in terms of disease-containment processes.

“Our new label printers are extremely straightforward to set up and require zero intervention from our staff. Our label printers are so well integrated and can produce labels as dictated by our patient record system, giving our staff one less thing to think about.”
